

ABSTRACT

A film-forming starchy composition for the film-coating of solid forms or the preparation of films. The inventive composition has an amylose content of between 25 and 45 %, preferably between 30 and 44 % and still more preferably between 35 and 40 %, the percentages being expressed by dry weight in relation to the dry weight of starch contained in the composition, and includes at least one stabilized starch. A method for the film-coating of solid forms is disclosed and includes spraying the film-forming composition onto a moving nuclei bed. The film-forming composition is used for the production of films and capsules.
